Notice of Statnamic Load Test

Wednesday June 25, 2014—10 am to 12pm

What is a Statnamic Load Test?

Statnamic load testing is a test that measures the carrying capacity of the deep foundations utilized on the construction of this garage. This test is faster and more cost effective than the typical static load test. The process for this test involves accelerating a mass upwards that places a load downward on the foundation. This is accomplished by the use combustion of a fast burning fuel creating force by controlling the high pressure gas resulting from the combustion. During the test, measurements are taken that will be used to confirm the design of the foundations.

Stages of a Statnamic Load Test

Why are you receiving this notice?

The testing device itself is equipped with a silencer to minimize the sound put out by the test, but when the gas discharges there will be a sound similar to that of a gunshot. The local authorities have been contacted and are aware of the test times. This sound will occur for less than a second and we will maintain a safe distance around the site as required.

We apologize in advance for the disruption that may occur with this test and appreciate the ongoing support of the community. If you have any questions do not hesitate to contact Chris Brown at cbrown@admorgan.com
